

## **Teaching strategies in the lesson on support in plants**

### **1. Use real-life examples:**

- Provide realistic examples to students about support in plants. For example, use native plants and explain how they rely on roots, stems and leaves to grow and survive.

### **2. Direct interaction with plants:**

- Take a tour of the school garden or local park with the students.
- Let them observe different types of plants and their different parts.

### **3. Taking advantage of visual means:**

- Use presentation slides or illustrations to explain propagation in plants.
- You can also view short videos explaining different plant tissues.

### **4. Interaction with students:**

- Ask questions and challenges to students during the explanation.
- Use discussion and active participation to stimulate their understanding and interaction.

### **5. Focus on practical matters:**

- Explain how students can apply the concepts of support in plants in their daily lives.
- For example, how plants can be part of home or garden decor.

### **6. Interact with live examples:**

- Introduce live plants into the classroom and let students observe their parts.
- Ask them to interact with the plants and identify the roots, stems and leaves.
